

Sisyrinchium angustifolium

Blue-eyed grass

Sisyrinchium angustifolium is a low rhizomatous wildflower that forms dense tufted clumps of narrow sword shaped leaves with starry bright blue flowers rising above the leaves.

Prefers Sun or light shade with moist soils.

Height: 12-18 inches Spread: 12-18 inches

Bloom Time: April, May, June

Bloom color: Blue

Sisyrinchium angustifolium forms attractive spreading rosettes of narrow iris-like foliage.

The numerous, narrow, light-green leaves of this perennial form dense, tufted clumps which steadily grow with new foliage during the season. The flattened, leaf-like flowering stems may be up to 18 in. long and bear light-blue, star-shaped flowers a few inches above the leaves. Several delicate, blue or deep blue-violet flowers with yellow centers in 2 broad bracts top a flat stem, generally only 1 flower at a time in bloom; stems taller than the clusters of narrow, sword-shaped leaves near base.

Halictine bees, Bumblebees, other native bees and pollinating flies seek nectar and pollen from the flowers. Seeds are eaten by various birds.
